

10 ChatGPT Prompts for Crypto Traders

Free Preview — The Best 10 From Our 100-Prompt Pack

■ MARKET ANALYSIS

#1. BTC/ETH Key Level Scanner

"Analyze [COIN] on the [4H/Daily] timeframe. Identify the 3 strongest support levels and 3 resistance levels based on recent price action. For each level, explain WHY it matters (previous rejection, volume cluster, or Fibonacci level). Rate each level 1-5 for strength."

Why this works: Gives you the exact levels that matter, with reasoning. Stop guessing where to set stops.

#2. Multi-Timeframe Trend Check

"I need a multi-timeframe analysis for [COIN]. Check the 1H, 4H, Daily, and Weekly charts. For each timeframe tell me: trend direction (bullish/bearish/neutral), RSI reading, whether MACD is bullish or bearish, and the key level to watch. Summarize with an overall bias and confidence level 1-10."

Why this works: One prompt replaces checking 4 charts manually. Takes 30 seconds instead of 30 minutes.

#3. 3-Scenario Price Forecast

"Based on current [COIN] price at \$[PRICE] and recent market structure, give me 3 scenarios for the next 7 days: Bull case (probability %), Base case (probability %), Bear case (probability %). For each scenario, include target price, key trigger event, and recommended position."

Why this works: Professional-grade scenario analysis. Use this before any position above \$500.

■ TRADING STRATEGY

#4. Position Size Calculator

"I have a \$[PORTFOLIO_SIZE] portfolio and want to trade [COIN] at \$[ENTRY_PRICE]. My risk tolerance is [X]% per trade. Calculate: optimal position size in USD and coins, stop loss level for 1:3 risk/reward, 3 take-profit targets, and the maximum drawdown I would experience."

Why this works: Never oversize a position again. This prompt saved me from 3 bad trades last month.

#5. Entry/Exit Strategy Builder

"Build me a complete trading plan for [COIN]. Current price: \$[PRICE]. I'm [BULLISH/BEARISH]. Include: ideal entry zone (not a single price – a range), stop loss with reasoning, 3 take-profit levels with % allocation for each, and conditions that invalidate the trade."

Why this works: Complete trade plan in under 60 seconds. No more entering trades without a plan.

#6. Risk/Reward Analyzer

"I'm considering entering [COIN] at \$[ENTRY], stop at \$[STOP], target at \$[TARGET]. Analyze this trade: What's the risk/reward ratio? Is it worth taking? What's the breakeven win rate needed? Compare to the historical win rate of similar setups. Give me a GO/NO-GO recommendation."

Why this works: The prompt that stops you from taking bad trades. Use before every entry.

■ DEFI RESEARCH

#7. Protocol Risk Scorer

"Evaluate [DEFI_PROTOCOL] as an investment opportunity. Score it 1-10 on: Smart contract audit status, Team transparency and track record, TVL trend (growing/declining), Tokenomics sustainability, Community activity level. Give an overall risk rating and tell me if the yield is worth the risk."

Why this works: Due diligence that usually takes 2 hours, done in 2 minutes.

#8. Yield Farming Calculator

"I want to provide liquidity to [POOL] on [DEX]. Pool details: [TOKEN_A]/[TOKEN_B], current APY [X]%. With \$[AMOUNT] investment, calculate: expected daily/weekly/monthly yield in USD, impermanent loss risk at 10%, 25%, and 50% price divergence, net profit after IL at each scenario, and break-even timeframe."

Why this works: Finally understand if that 200% APY is actually worth it after impermanent loss.

■ NEWS & SENTIMENT

#9. News Impact Scorer

"Analyze this crypto news: '[PASTE_HEADLINE_OR_ARTICLE]'. Rate the market impact 1-10. Tell me: which coins are most affected, expected price direction (up/down/neutral), timeframe of impact (immediate/24h/1week), and whether this is already priced in or a fresh catalyst."

Why this works: Stop panic-selling on FUD. This prompt tells you if the news actually matters.

#10. Sentiment Radar

"Give me a sentiment analysis for [COIN] right now. Check: overall market sentiment (Fear & Greed equivalent), social media buzz level, whale activity (accumulating or distributing), exchange inflow/outflow trend, and funding rates. Summarize: is the crowd bullish or bearish, and historically what happens next in this sentiment regime?"

Why this works: Know what the crowd thinks — then decide if you agree or want to fade them.
